3   Descriptive statistics

Engineering data are always variable. Given precise enough measurement, even constant process conditions produce different responses. Thus, it is not the individual data values that are important, but their **distribution**. We will discuss simple methods that describe important distributional characteristics of data.

Definition 3.1. *Descriptive statistics* is the use of plots and numerical summaries to describe data without drawing any formal conclusions.

Through the use of *descriptive statistics*, we seek to find the following features of data sets:

1. Center

   the point that the data are closest to on average

2. Spread

   how wide the data look, how varied the points are

3. Shape

   Common patterns / trends that are present in the data

4. Outliers

   points that lie beyond the rest of the data
   (weird points)

1

3.1 Graphical and tabular displays of <u>quantitative data</u>

numerical values

Almost always, the place to start a data analysis is with appropriate graphical and tabular displays. When only a few samples are involved, a good plot can tell most of the story about data and drive an analysis.

in an analysis, start by plotting!

3.1.1 Dot diagrams and stem-and-leaf plots

↗ at most hundreds(?)

When a study produces a small or moderate amount of (**univariate**) **quantitative data**, a

↓ only a single characteristic is observed   *↳ numeric (ch. 1).*

dot diagram can be useful.

Definition 3.2. A *dot diagram* shows each observation as a dot placed at the position corresponding to its numerical value along a number line.

Example 3.1 (Heat treating gears, cont'd)**.** Recall the example from Chapter 1. A process engineer is faced with the question, "How should gears be loaded into a continuous carburizing furnace in order to minimize distortion during heat treating?" The engineer conducts a well-thought-out study and obtains the runout values for 38 gears laid and 39 gears hung.
39 hung = 39 dots   *38 laid = 38 dots*

Runout = variable of interest (10⁻⁴ inches)

Figure 1: Dot diagrams of runouts.

each dot represents a gear in the study .

laid values are generally smaller and more consistent than hung gears.

2

Example 3.2 (Bullet penetration depth, pg. 67)**.** Sale and Thom compared penetration depths for several types of .45 caliber bullets fired into oak wood from a distance of 15 feet. They recorded the penetration depths (in mm from the target surface to the back of the bullets) for two bullet types.

| 200 grain jacketed bullets	230 grain jacketed bullets
63.8, 64.65, 59.5, 60.7, 61.3, 61.5, 59.8, 59.1, 62.95, 63.55, 58.65, 71.7, 63.3, 62.65, 67.75, 62.3, 70.4, 64.05, 65, 58	40.5, 38.35, 56, 42.55, 38.35, 27.75, 49.85, 43.6, 38.75, 51.25, 47.9, 48.15, 42.9, 43.85, 37.35, 47.3, 41.15, 51.6, 39.75, 41

Table 1: Bullet penetration depths (mm)

Figure 2: Dot diagrams of penetration depths.

– 200 grain bullets center around a larger value.

– 230 grain bullets have a larger spread

3

Dot diagrams are good for getting a general feel for the data (and can be done with pencil and paper), but do not allow the recovery of the exact values used to make them.

Definition 3.3. A *stem-and-leaf plot* is made by using the last few digits of each data point to indicated where it falls.

Example 3.3 (Heat treating gears, cont'd)**.**

[handwritten: "leaves" second digit of each observation]

[handwritten top right: 05, 08, 09, 09, 09, 69]

hung	laid
7, 8, 8, 10, 10, 10, 10, 11, 11,	5, 8, 8, 9, 9, 9, 9, 10, 10, 10,
11, 12, 13, 13, 13, 15, 17, 17,	11, 11, 11, 11, 11, 11, 11, 12,
17, 17, 18, 19, 19, 20, 21, 21,	12, 12, 12, 13, 13, 13, 13, 14,
21, 22, 22, 22, 23, 23, 23, 23,	14, 14, 15, 15, 15, 15, 16, 17,

[handwritten: "back to back" "side to side"] 4

3.1.2 Frequency tables and histograms

Dot diagrams and stem-and-leaf plots are useful for getting to know a data set, but they are not commonly used in papers and presentations.

Definition 3.4. A *frequency table* is made by first breaking an interval containing all the data into an appropriate number of smaller intervals of equal length. Then tally marks can be recorded to indicate the number of data points falling into each interval. Finally, frequencies, relative frequencies, and cumulative relative frequencies can be added.

Example 3.4 (Heat treating gears, cont'd).

3/38

choice of interval is arbitrary

① intervals are equal sizes

② rounded numbers are prefered

Runout (.0001 in)	Tally	Frequency	Relative Frequency	Cumulative Relative Frequency
5-8	|||	3	.079	.079
9-12	||||| ||||| ||||| |||	18	.474	.553 ← .079 + .474
13-16	||||| ||||| ||	12	.316	.868 ← .553 + .316
17-20	||||	4	.105	.974
21-24		0	0	.974
25-28			1	.026	1.000 ←
		38	1.000	

↳ # of data points

Table 3: Frequency table for laid gear thrust face runouts.

Example 3.5 (Bullet penetration depth, cont'd).

5/20

Runout (.0001 in)	Tally	Frequency	Relative Frequency	Cumulative Relative Frequency
58-59.99	|||||	5	.25	.25
60.00-61.99	|||	3	.15	.40 ← .25+.15
62.00-63.99	|||||		6	.30	.70

66.00-67.99			1	.05	.90
68.00-69.99		0	0	.90
70.00-71.99	||	2	.10	1.000
		20	1.000	

# of data points

Table 4: Frequency table for 200 grain penetration depths.

5

frequency table $\Rightarrow$ histogram (easy)

After making a frequency table, it is common to use the organization provided by the table to create a histogram.

Definition 3.5. A *(frequency or relative frequency) histogram* is a kind of bar chart used to portray the shape of a distribution of data points.

Guidelines for making histograms:

① use intervals of equal length
② show the entire vertical axis starting at zero
③ avoid breaking either axis
④ keep a uniform scale for axes (tick marks)
⑤ center bars of the appropriate heights at the midpoint of the intervals.
Example 3.6 (Bullet penetration depth, cont'd).

Figure 3: Histogram of the 200 grain penetration depths.

**Example 3.7** (Histogram). Suppose you have the following data:

$$74, 79, 77, 81, \underline{68}, 79, 81, 76, 81, 80, 80, 78, 88, 83, 79, 91, 79, \underline{75}, \underline{74}, \underline{73}$$

. Create the corresponding *frequency table* and *frequency histogram*. Using intervals of 4.

Frequency table

group	tally	Frq	Rel Frq	Cumulative Frq
66-70	I	1	$1/20 = .05$	.05
71-75	IIII	4	$4/20 = .2$	.25
76-80	IIII IIII	9	$9/20 = .45$	.7
81-85	IIII	4	$4/20 = .2$	.9
86-90	I	1	$1/20 = .05$	.95
91-95	I	1	$1/20 = .05$	1
		$\overline{20}$	$\overline{1}$	

Histogram

Why do we plot data? Information on location, spread, and shape is portrayed clearly in a histogram and can give hints as to the functioning of the physical process that is generating the data.

"center"
① ② ②

Bell–shaped — *"normal"*
Bimodal — *2 "modes" "peaks"*
Left–skewed — *long left tail compared to bell shape*

– unimodal (1 peak)
– peak is in the center
– symmetric w.r.t. its center

Right–skewed — *long right tail compared to bell shape*
Truncated — *cut off point*
**Uniform** — *flat*

Figure 4: Common distributional shapes.

If data on the diameters of machined metal cylinders purchased from a vendor produce a histogram that is decidedly **bimodal**, this suggests

The machining was done on 2 machines or by two operators or at two times, etc...

If the histogram is **truncated**, this might suggest

The cylinders have been inspected and all cylinders w/ excess diameter removed.

3.1.3 Scatter plots

Dot-diagrams, stem-and-leaf plots, frequency tables, and histograms are univariate tools. But engineering questions often concern multivariate data and *relationships between the variables.*
[quantitative]

Definition 3.6. A *scatterplot* is a simple and effective way of displaying potential relationships between two quantitative variables by assigning each variable to either the x or y axis and plotting the resulting coordinate points.

Example 3.8 (Orange trees)**.** Jim and Jane want to know the relationship between an orange tree's age (in days since 1968-12-31) and its circumference (in mm). They recorded the data for 35 orange trees.
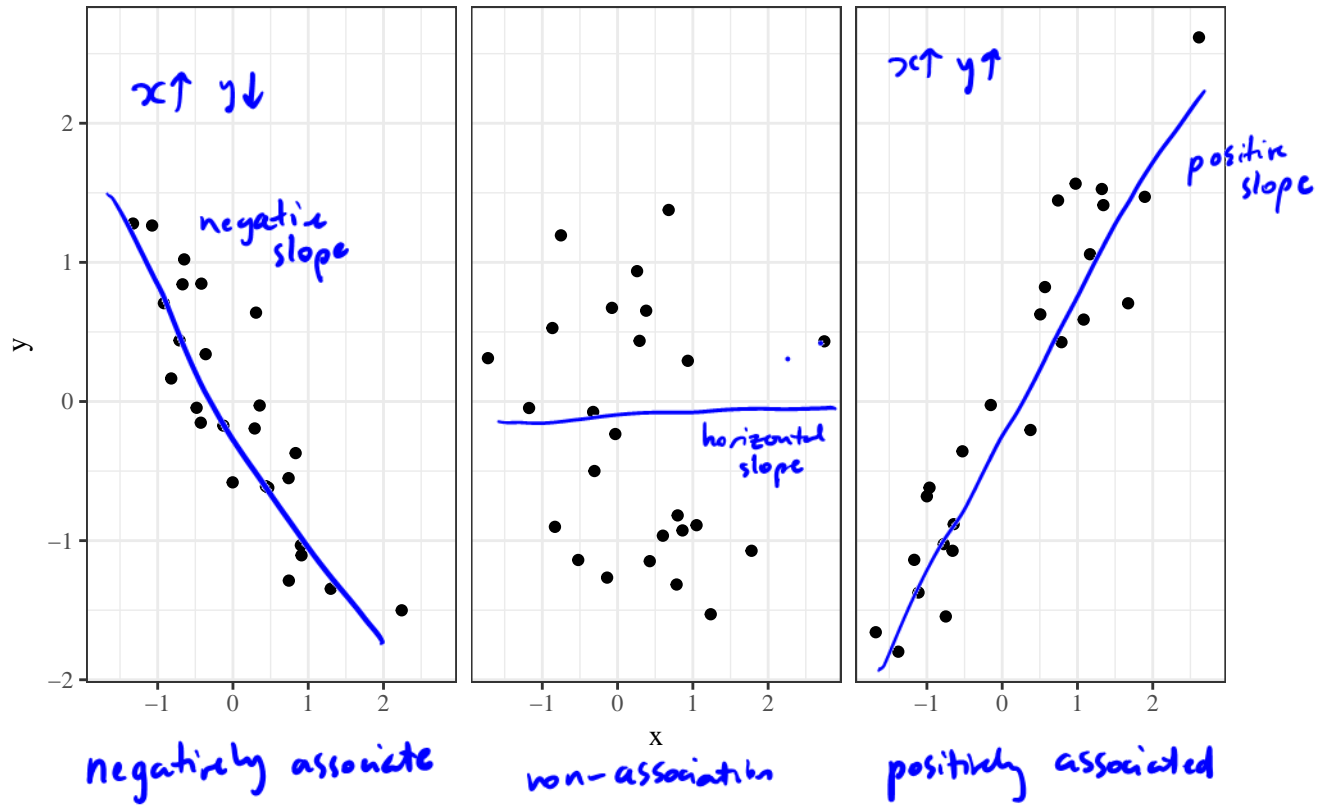

→ 35 points

Figure 5: Scatterplot of 35 trees' age and circumference.

older trees are associated w/ larger circumferences
(positive association/relationship)

older trees have more variability in circumference.

There are three typical association/relationship between two variables:

x↑ y↓

negative slope

negatively associated

horizontal slope

non-association

x↑ y↑

positive slope

positively associated

Definition 3.7. A *run chart* is a basic graph that displays data values in a time sequence in the order in which the data were generated.

Example 3.9 (Office hours). A professor collects data on the number of students that come to her office hours per week during the course of the semester.

ordered time variable

quantitative.

Week	Attendance
1	0.00
2	1.00
3	4.00
4	5.00
5	40.00
6	2.00
7	5.00
8	10.00
9	7.00
10	30.00
11	0.00
12	4.00
13	3.00
14	19.00
15	60.00

Table 5: Weekly attendance in office hours for a semester.

11.
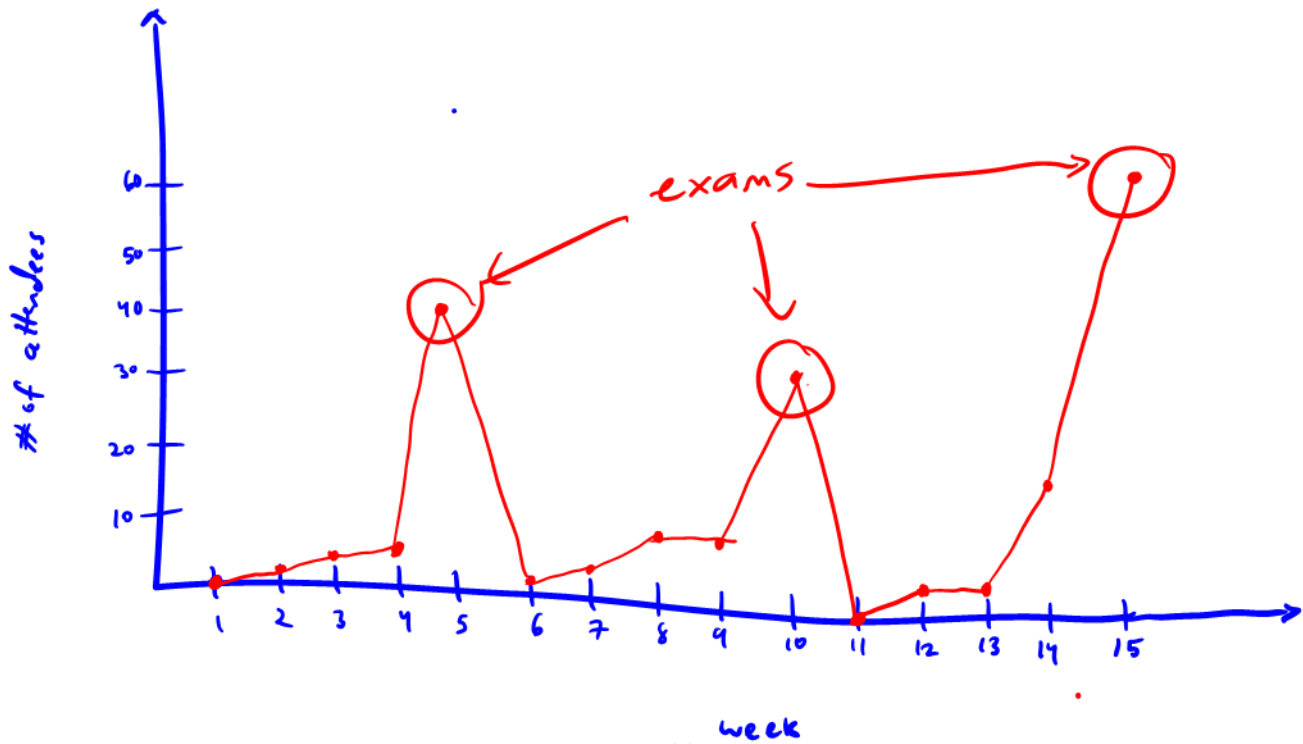

3.2 Quantiles

Most people are probably familiar with the idea of *percentiles*. [handwritten: 0% − 100%]

Definition 3.8. The pth *percentile* of a data set is a number greater than $p\%$ of the data and less than the rest.

"You scored at the 90th percentile on the SAT" means that your score was higher than 90% of the students who took the test and lower than the other 10%
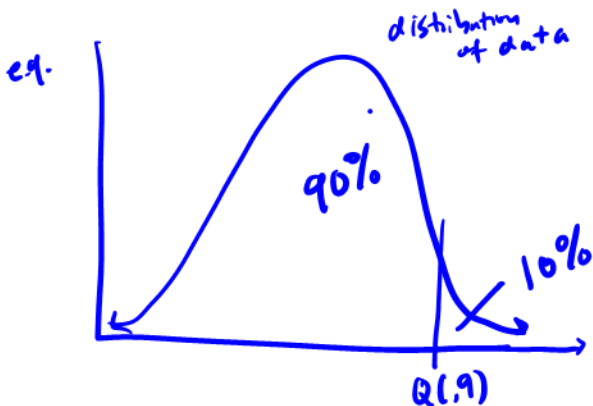

"Zorbit was positioned at the 80th percentile of the list of fastest growing companies compiled by INC magazine." means Zorbit was growing faster than 80% of the companies in the list and slower than the other 20%.

It is often more convenient to work in terms of fractions between 0 and 1 than percentages.

Definition 3.9. For a data set consisting of n values that when ordered are $x_1 \leq x_2 \leq \cdots \leq x_n$,

[handwritten left margin: how to calculate $Q(p)$.]

1. if $p = \frac{i-.5}{n}$ for a positive integer $i \leq n$, the p *quantile* of the data set is   [handwritten: Dataset ($n=3$)]

   [handwritten: $i = 1, 2, 3$]

$$Q(p) = Q\left(\frac{i-.5}{n}\right) = x_i$$

   [handwritten: $p = \frac{1-.5}{3} = \frac{1}{6}$ $Q(\frac{1}{6}) = x_1$]

   [handwritten: $p = \frac{2-.5}{3}$ $Q(\frac{2-.5}{6}) = x_2$]

   (the ith smallest data point will be called the $\frac{i-.5}{n}$ quantile) [handwritten: $p = \frac{3-.5}{3}$ $Q(\frac{3-.5}{6}) = x_3$]

2. for any number p between $\frac{.5}{n}$ and $\frac{n-.5}{n}$ that is not of the form $\frac{i-.5}{n}$ for an integer i, the p *quantile* of the data set will be obtained by linear interpolation between the two values of $Q\left(\frac{i-.5}{n}\right)$ with corresponding $\frac{i-.5}{n}$ that bracket p.

   [handwritten: $Q(p)$]

In both cases, the notation $Q(p)$ will denote the p quantile.

[handwritten: $\frac{i-1-.5}{n}$ p $\frac{i-.5}{n}$]

[handwritten left margin: eq.]

[handwritten: distribution of data]

[handwritten: 90%]

[handwritten: 10%]

[handwritten: $Q(.9)$]

[handwritten: p quantile of a distribution is a number such that a fraction p of the dsn lies to the left of the number and a fraction $1-p$ of the distribution lies to the right.]

12

Example 3.10 (Breaking strengths of paper towels, pg. 79). Here is a study of the dry breaking strength (in grams) of generic paper towels. $\boxed{n=10}$

i	$\frac{i-.5}{n} = p_i$	$x_i = Q(\frac{i-.5}{n})$
1	0.05	7583
2	0.15	8527 ←
3	0.25	8572 ←
4	0.35	8577
5	0.45	9011 .
6	0.55	9165
7	0.65	9471
8	0.75	9614
9	0.85	9614
10	0.95	10688

test	strength
1	8577
2	9471
3	9011
4	7583
5	8572
6	10688
7	9614
8	9614
9	8527
10	9165

Table 6: Ten paper towls breaking strengths (in grams).

① Let $p_i = \frac{i-.5}{n}$ $i = 1, \ldots, n$

② Define $Q(p_i) = x_i$ $i = 1, \ldots n$

a) if $p = p_i$ from some index i

then Let $Q(p) = Q(p_i) = x_i$

b) otherwise linearly interpolate:

  i) $i' = np + .5$

  ii) $Q(p) = (\lceil i' \rceil - i') x_{\lfloor i' \rfloor} + (i' - \lfloor i' \rfloor) x_{\lceil i' \rceil}$

$\lceil i' \rceil$ = "ceiling" = next integer above i'

$\lfloor i' \rfloor$ = "floor" = previous integer below i'

$Q(.5)$

i) $i' = np + .5 = 10(.5) + .5 = 5.5$

  $\lceil i' \rceil = 6$ $\lfloor i' \rfloor = 5$

ii) $Q(p) = (6 - 5.5) x_5 + (5.5 - 5) x_6$

  $= 0.5(9011) + 0.5(9165)$

  $= 9088$ grams

$p = .5$ $\dfrac{.5 - .45}{.55 - .45} = 0.5$

0.5 is 0.5 of the way between .45 and .55

```
  ——+———+———+——
   .45  p=.5  .55
```

$Q(p) = 0.5 \, Q(.45) + 0.5 \, Q(.55)$

  $= 0.5(9011) + 0.5(9165)$

  $= 9088$ grains

$p = .18$ i) $i' = np + .5 = 10(.18) + .5 = 2.3$

  $\lceil i' \rceil = 3$ $\lfloor i' \rfloor = 2$

ii) $Q(.18) = (3 - 2.3) x_2 + (2.3 - 2) x_3$

  $= 0.7(8527) + 0.3(8572)$

  $= 8540.5$ grams

$\dfrac{.18 - .15}{.25 - .15} = 0.3$

.18 is .3 of the way between .15 and .25

```
  ——+———+———+——
   .15  .18   .25
```

$Q(.18) = 0.7 \, Q(.15) + .3 \, Q(.25)$

  $= 6.7(8527) + 6.3(8572)$
  $= 8540.5$

$p = .94$

i) $i' = np + .5 = 10(.94) + .5 = 9.9$

  $\lceil i' \rceil = 10$ $\lfloor i' \rfloor = 9$

ii) $Q(p) = (10 - 9.9) x_9 + (9.9 - 9) x_{10}$

  $= .1(9614) + .9(10688)$

  $= 10580.6$ grams

$\dfrac{.94 - .85}{.95 - .85} = .9$

```
  ——+——————+——+—
   .85      .94 .95
```

$Q(.94) = .9 \, Q(.95) + .1 \, Q(.85)$

  $= .9(10688) + .1(9614)$

  $= 10580.6$ grams

$$\frac{q(p) - Q\left(\frac{i-1-.5}{n}\right)}{p - \frac{i-1-.5}{n}} = \frac{Q\left(\frac{i-.5}{n}\right) - Q\left(\frac{i-1-.5}{n}\right)}{\frac{i-.5}{n} - \frac{i-1-.5}{n}}$$

Definition 3.10. $Q\left(\frac{1-.5}{n}\right)$ is called the *minimum* and $Q\left(\frac{n-.5}{n}\right)$ is called the *maximum* of a distribution.

[handwritten: x_1 above $\frac{1-.5}{n}$, x_n above $\frac{n-.5}{n}$]

Definition 3.11. $Q(.5)$ is called the *median* of a distribution. $Q(.25)$ and $Q(.75)$ are called the *first (or lower) quartile* and *third (or upper) quartile* of a distribution, respectively.
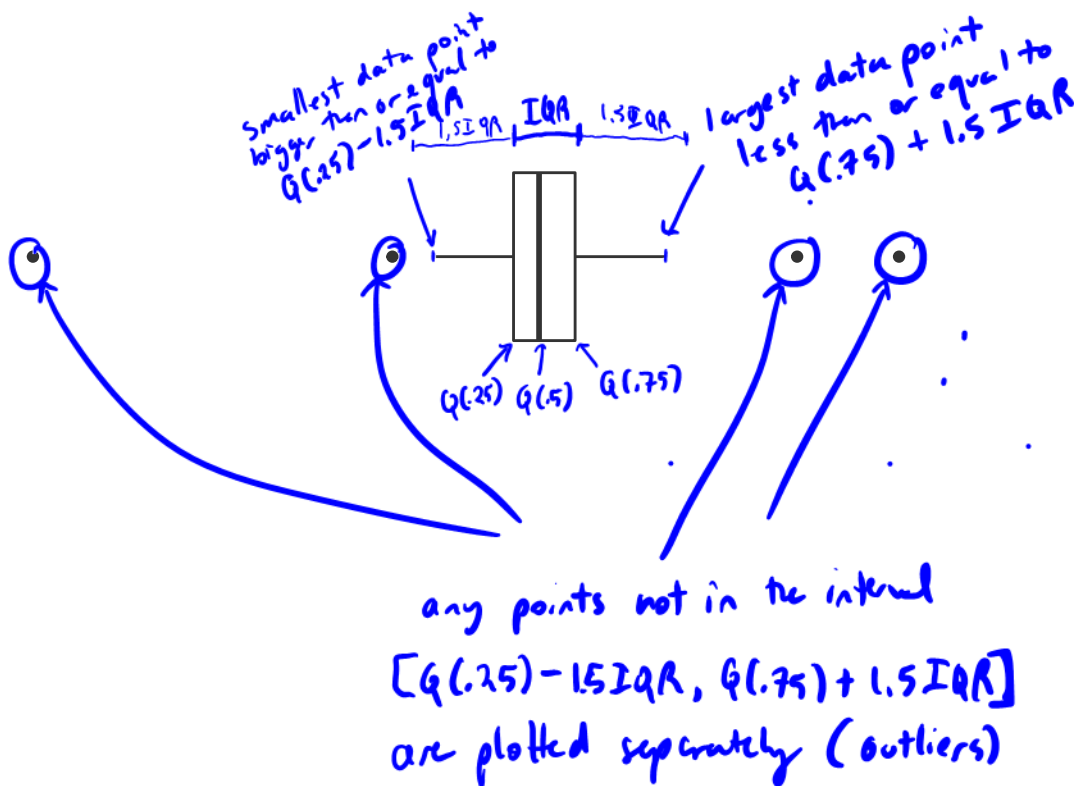

Definition 3.12. The *interquartile range (IQR)* is defined as $IQR = Q(.75) - Q(.25)$.

Definition 3.13. An *outlier* is a data point that is larger than $Q(.75) + 1.5*IQR$ or smaller than $Q(.25) - 1.5*IQR$.

[handwritten: Most points should be below $Q(.75) + 1.5 \times IQR$ and above $Q(.25) - 1.5 \times IQR$.]

3.2.1 Boxplots

Quantiles are useful in making *boxplots*, an alternative to dot diagrams or histograms. The boxplot shows less information, but many can be placed side by side on a single page for comparisons.

[handwritten annotations:
smallest data point bigger than or equal to $Q(.25) - 1.5 \times IQR$
IQR, 1.5 IQR, 1.5 IQR
largest data point less than or equal to $Q(.75) + 1.5 IQR$
$Q(.25)$ $Q(.5)$ $Q(.75)$
any points not in the interval $[Q(.25) - 1.5 IQR, Q(.75) + 1.5 IQR]$ are plotted separately (outliers)]

14

Example 3.11 (Bullet penetration depths, cont'd).

i	$\frac{i-.5}{20}$	200 grain bullets	230 grain bullets
1	0.025	58.000	27.750
2	0.075	58.650	37.350
3	0.125	59.100	38.350
4	0.175	59.500	38.350
5	0.225	59.800	38.750
6	0.275	60.700	39.750
7	0.325	61.300	40.500
8	0.375	61.500	41.000
9	0.425	62.300	41.150
10	0.475	62.650	42.550
11	0.525	62.950	42.900
12	0.575	63.300	43.600
13	0.625	63.550	43.850
14	0.675	63.800	47.300
15	0.725	64.050	47.900
16	0.775	64.650	48.150
17	0.825	65.000	49.850
18	0.875	67.750	51.250
19	0.925	70.400	51.600
20	0.975	71.700	56.000

Table 7: Quantiles of the bullet penetration depth distributions.

create a boxplot for 230 grain bullets

$$Q(.25) = .5 Q(.225) + .5 Q(.275) = .5(38.75) + .5(39.75) = 39.25 \text{ mm}$$
$$Q(.5) = .5 Q(.475) + .5 Q(.525) = .5(42.55) + .5(42.9) = 42.725 \text{ mm}$$
$$Q(.75) = .5 Q(.725) + .5 Q(.775) = .5(47.9) + .5(48.15) = 48.025 \text{ mm}$$

$$IQR = Q(.75) - Q(.25) = 48.025 - 39.25 = 8.775$$
$$1.5 IQR = 13.163$$

$$Q(.75) + 1.5 IQR = 61.88 \text{ mm}$$
$$Q(.25) - 1.5 IQR = 26.087 \text{ mm}$$
$$\Rightarrow \text{ no outliers}$$

230 grain bullets

27.75   39.25 42.725 48.025   56

25 30 35 40 45 50 55 60 15

Doing the same for 200 grain bullets and plot the two distributions (boxplots) side by side.

$$Q(.25) = 0.5 \, Q(.225) + 0.5 \, Q(.275) = 0.5(59.8) + 0.5(60.7) = 60.25$$
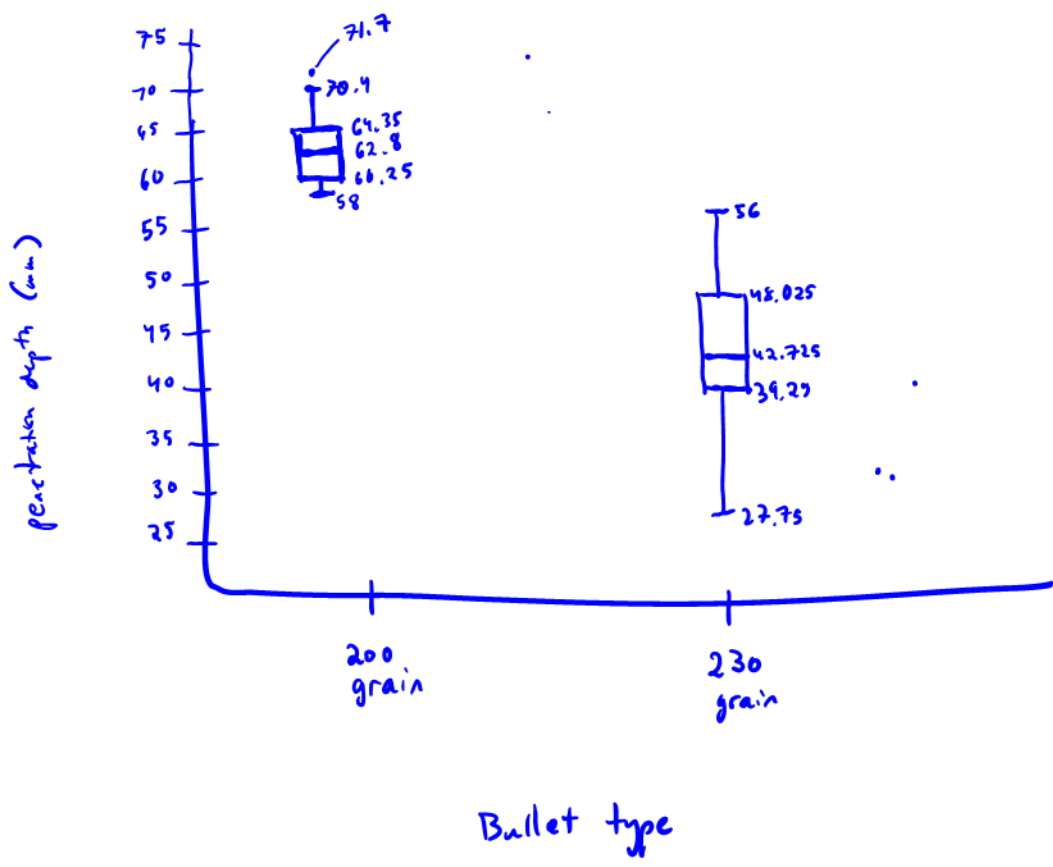

$$Q(.5) = .5(62.65) + 0.5(62.95) = 62.8$$

$$Q(.75) = .5(64.05) + 0.5(64.65) = 64.35$$

200 grain bullets

$$IQR = 64.35 - 60.25 = 4.1$$

$$1.5 \, IQR = 6.15$$

$$Q(.75) + 1.5 \, IQR = 70.5 \quad \longleftarrow \quad 1 \text{ outlier}$$

$$Q(.25) - 1.5 \, IQR = 54.1$$

penetration depth (mm)

Bullet type

3.2.2 Quantile-quantile (Q-Q) plots

Often times, we want to compare the shapes of two distributions.

We could compare two histograms, dotplots, boxplots.

A more sensitive way is to make a single plot based on the quantile functions for two distributions.

"equal shape" = quantile functions will be linearly related.

Definition 3.14. A *Q-Q plot* for two data sets with respective quantile functions Q_1 and Q_2 is a plot of ordered pairs $(Q_1(p), Q_2(p))$ for appropriate values of p. When two data sets *(two univariate numeric)* of size n are involved, the values of p used to make the plot will be $\frac{i-.5}{n}$ for $i = 1, \ldots, n$.

scatter plot

equal size

Example 3.12 (Bullet penetration depth, cont'd).

jump

not very linear

looks linear

large jump

except for extreme lower values and the upper part of the distribution, distributions look similar in shape
Figure 6: Q-Q plot for the bullet penetration depths.

overall not super linear

17

To make a Q-Q plot for two data sets of the same size,

1. order each from the smallest observation to the largest,

2. pair off corresponding values in the two data sets

3. plot ordered pairs, with the horizontal coordinates coming from the first data set and the vertical ones from the second.

Example 3.13 (Q-Q plot by hand). Make a Q-Q plot for the following small artificial data sets.
Data set 1	Data set 2
3, 5, 4, 7, 3	15, 7, 9, 7, 11

Table 8: Two artificial data sets

1. order

Set 1 ③ ③ 4 5 7
Set 2 ⑦ ⑦ 9 11 15

2. pair off   (3,7) , (3,7), (4,9), (5,11), (7,15)

3. scatter plot

perfectly linear ⟹ exact same distributional shape .

Data set 1

Dot diagrams

scale/ location differed, but same shape

18

3.2.3   Theoretical quantile-quantile plots

Q-Q plots are useful when comparing two finite data sets, but a Q-Q plot can also be used to compare a data set and an expected shape, or *theoretical distribution.*

Definition 3.15. A *theoretical Q-Q plot* for a data set of size n and a theoretical distribution, with respective quantile functions Q_1 and Q_2 is a plot of ordered pairs $(Q_1(p), Q_2(p))$ for $p = \frac{i-.5}{n}$ where $i = 1, \ldots, n$.

bell shaped

The most famous theoretical Q-Q plot occurs when quantiles for the *standard Normal* or *Gaussian* distribution are used. A simple numerical approximation to the quantile function for the Normal distribution is

$$Q(p) \approx 4.9(p^{.14} - (1-p)^{.14}).$$

The standard Normal quantiles can be used to make a theoretical Q-Q plot as a way of assessing how bell-shaped a data set is. The resulting plot is called a *normal Q-Q plot.*

"normal plot"

19
**Example 3.14** (Breaking strengths of paper towels, cont'd).

$Q\left(\frac{i-.5}{10}\right) = x_i$ ordered data

$\approx 4.9\left(p_i^{.14} - (1-p_i)^{.14}\right)$ where $p_i = \frac{i-.5}{10}$, $i = 1, \cdots, 10$

i	$\frac{i-.5}{10}$	Breaking strength Q()	Standard Normal Q()
1	0.05	7583	-1.64
2	0.15	8527	-1.04
3	0.25	8572	-0.67
4	0.35	8577	-0.39
5	0.45	9011	-0.13
6	0.55	9165	0.13
7	0.65	9471	0.39
8	0.75	9614	0.67
9	0.85	9614	1.04
10	0.95	10688	1.64

$(7583, -1.64)$
$(8527, -1.04)$

$(10688, 1.64)$

Table 9: Breaking strength and standard Normal quantiles.
roughly straight qq plot
$\Rightarrow$ breaking strength data
is roughly bell shaped.

3.3 Numerical summaries

When we have a large amount of data, it can become important to reduce the amount of data to a few informative numerical summary values. Numerical summaries highlight important features of the data

For example keep daily average and range measurements.

Definition 3.16. A *numerical summary (or statistic)* is a number or list of numbers calculated using the data (and only the data).

3.3.1 Measures of location

or location

An "average" represents the center of a quantitative data set. There are several potential technical meanings for the word "average", and they are all *measures of location.*

Definition 3.17. The *(arithmetic) mean* of a sample of quantitative data $(x_1, \ldots, x_n)$ is

$$\overline{x} = \frac{1}{n} \sum_{i=1}^{n} x_i.$$

Definition 3.18. The *mode* of a discrete or categorical data set is the most frequently-occurring value.

We have also seen the *median*, $Q(.5)$, which is another measure of location. A shortcut to calculating $Q(0.5)$ is

$\lceil . \rceil$ *"ceiling"* $\lceil .2 \rceil = 1$
$\lceil 1 \rceil = 1$

- $Q(0.5) = x_{\lceil n/2 \rceil}$ if n is odd
- $Q(0.5) = (x_{n/2} + x_{n/2+1})/2$ if n is even.

Example 3.15 (Measures of location)**.** Calculate the three measures of location for the following data.

$$0, 1, 1, 2, 3, 5 \qquad n=6$$

mean: $\bar{x} = \frac{1}{n} \sum_{i=1}^{n} x_i = \frac{1}{6}(0 + 1 + 1 + 2 + 3 + 5) = 2$

median: n is even $\qquad Q(.5) = \frac{1+2}{2} = 1.5$

mode: **1**

3.3.2 Measures of spread

Quantifying variation in a data set can be as important as measuring its location. Again, there are many way to measure the spread of a data set.

Definition 3.19. The *range* of a data set consisting of ordered values $x_1 \leq \cdots \leq x_n$ is

$$R = x_n - x_1.$$

Definition 3.20. The *sample variance* of a data set consisting of values $x_1, \ldots, x_n$ is

$$s^2 = \frac{1}{n-1} \sum_{i=1}^{n} (x_i - \bar{x})^2.$$

The *sample standard deviation, s,* is the nonnegative square root of the sample variance.

We have also seen the *IQR*, $Q(.75) - Q(.25)$, which is another measure of spread.

Example 3.16 (Measures of spread). Calculate the four measures of spread for the following data.

$$0, 1, 1, 2, 3, 5$$

Example 3.17 (Sensitivity to outliers). Which measures of center and spread differ drastically between the x_is and the y_is? Which ones are the same?

$$x_i : 0, 1, 1, 2, 3, 5$$
$$y_i : 0, 1, 1, 2, 3, 817263489$$

3.3.3 Statistics and parameters

It's important now to stop and talk about terminology and notation.

Definition 3.21. Numerical summarizations of sample data are called (sample) *statistics*. Numerical summarizations of population and theoretical distributions are called (population or model) *parameters*.

Definition 3.22. If a data set, $x_1, \ldots, x_N$, represents an entire population, then the *population (or true) mean* is defined as

$$\mu = \frac{1}{N} \sum_{i=1}^{N} x_i.$$

Definition 3.23. If a data set, $x_1, \ldots, x_N$, represents an entire population, then the *population (or true) variance* is defined as

$$\sigma^2 = \frac{1}{N} \sum_{i=1}^{N} (x_i - \mu)^2.$$

The *population (or true) standard deviation, σ* is the nonnegative square root of σ^2.

3.4 Categorical and count data

So far we have talked mainly about summarizing quantitative, or measurement, data. Sometimes, we have categorical or count data to summarize. In this case, we can revisit the *frequency table* and introduce a new type of plot.

Example 3.18 (Cars)**.** Fuel consumption and 10 aspects of automobile design and performance are available for 32 automobiles (1973–74 models) from 1974 Motor Trend US Magazine.

	mpg	cyl	disp	hp	drat	wt	qsec	vs	am	gear	carb
Mazda RX4	21	6	160	110	3.9	2.62	16.46	0	1	4	4
Mazda RX4 Wag	21	6	160	110	3.9	2.875	17.02	0	1	4	4
Datsun 710	22.8	4	108	93	3.85	2.32	18.61	1	1	4	1
Hornet 4 Drive	21.4	6	258	110	3.08	3.215	19.44	1	0	3	1
Hornet Sportabout	18.7	8	360	175	3.15	3.44	17.02	0	0	3	2
Valiant	18.1	6	225	105	2.76	3.46	20.22	1	0	3	1
...	...	...	...	...	...	...	...	...	...	...	...

Table 10: Car data for 1973-1974 models.

We can construct a frequency table for the `cylinder` variable.

cyl	Frequency	Relative Frequency	Cumulative Frequency
4.00	11	0.34	0.34
6.00	7	0.22	0.56
8.00	14	0.44	1.00

Table 11: Frequency table for car cylinders.

From this frequency data, we can summarize the categorical data graphically.

Definition 3.24. A *bar plot* presents categorical data with rectangular bars with lengths proportional to the values that they represent (usually frequency of occurrence).

Example 3.19 (Cars, cont'd)**.**
